Animals have different features, including fins, wings, scales, legs, feathers, claws, paws etc. Some animals can be grouped into fish, amphibians, reptiles, birds and mammals (name common examples) 	<ul style="list-style-type: none"> Classification refers to a method used to place all living things into groups.(Yr4 Aut) Organisms can be classified in a number of ways A species is a group of one type of organism, individuals in this group can breed with each other to produce offspring that can go on to breed(Yr4 Aut) Early classification from Aristotle placed animals into groups based on land, water and air, plants were grouped according to size, small, medium and large(Yr4 Aut) Fish, amphibians, reptiles, birds and mammals are all vertebrates (Yr4 Aut) Vertebrates have endoskeletons (Yr4 Aut) Vertebrates can be grouped in a number of ways based on their characteristics, e.g. warm/cold blooded; or physical features like fur, beak, wings etc.(Yr4 Aut) Invertebrates can be grouped based on their characteristics as snails and slugs; worms; spiders and insects (Yr4 Aut)
Disciplinary	<ul style="list-style-type: none"> A&P: Scientists group objects or living things based on their properties (Y1 Spr) M&O: Gather information from text/books/images (Y1 Aut) R&P: Use a Carroll diagram to classify items based on properties (Y1 Spr) 	<p>Research different animals and use images and text to classify the animals as herbivores, carnivores or omnivores, and based on their physical characteristics</p> <ul style="list-style-type: none"> A&P: Scientists conduct secondary research to learn from what other scientists have already learned R&P: Use a Venn diagram to classify items into two or three sets based on properties 	<ul style="list-style-type: none"> A&E: Science is never 'complete' and scientists are always working to make models more accurate or to discover new explanations (Y5)
VCs		<ul style="list-style-type: none"> 8: There is a wide variety of living things, including plants and animals 	<ul style="list-style-type: none"> 8: Plants and animals are dependent on each other (Y2)

	Required prior knowledge	Knowledge to be explicitly taught	How knowledge will be built upon
Substantive	<ul style="list-style-type: none"> Animals can be grouped into fish, amphibians, reptiles, birds and mammals (name common examples) (Y1 Sum) Animals can be placed into different groups (carnivores, herbivores and omnivores) based the foods they eat (Y1 Sum) Materials have different physical properties, some materials are hard whilst others are soft, some can be described as rough whilst others are smooth, some are dull whereas others are shiny. (Y1 Spr) 	<ul style="list-style-type: none"> Humans are omnivores, but some choose to eat only plants Humans are made of many different body parts including head, neck, back, ears, eyes, nose, mouth, arms, shoulders, elbows, hands, fingers, legs, knees, feet, toes, face Humans have five senses, smell, taste, touch, sight and hearing. The five senses are each associated with different body parts (eyes, ears, nose, tongue) 	<ul style="list-style-type: none"> The main food groups are carbohydrates (starch and sugars), proteins, fats, dairy, fruit and vegetables (Y3 Spr) Humans need a balanced diet which is made of main food groups (Y3 Spr) Our skeleton is made up of bones that grow as we grow (Y3 Spr) Humans and some other animals have skeletons (Y3 Spr) Organs are parts of the body that do a particular job, the heart pumps blood around the body and the lungs are used for breathing which gets air into your body. (Y3 Spr) The skeleton protects organs, e.g. the skull protects the brain; and the ribcage protects the lungs, heart and other important organs (Y3 Spr) The skeleton supports the body, e.g. the spine helps the body stand (Y3 Spr) The skeleton helps the body move, e.g. pelvis and knee joints (Y3 Spr) The muscles and skeleton are required to help the body move. When muscles contract they pull the bone (Y3 Spr) Different animals hear different sounds (Y4 Spr) Humans' hearing changes as we age (Y4 Spr) Sounds are made when objects vibrate. Vibrations travel through a medium (e.g. air, water) to the ear. Vibrations enter the ear, our inner ear vibrates and we hear them as sound. (Y4 Spr) The eye is made of many parts: the pupil is the circular black hole in the center of the eye, the iris is the coloured part of the eye that surrounds the pupil, and the lens is a structure found behind the pupil. The pupils allow light to enter the eye. The iris controls how much light enters the eye by changing the size of the pupil. The lens helps to focus the light rays entering the eye (Y6 Spr) Many problems with our vision are caused by parts of the eye that are the not the right shape or size, or that have become cloudy. Many of these problems can be corrected through surgery or prescription glasses. People living with sight loss or blindness may use long canes or guide dogs when outside, talking books or Braille, and different devices in the home (Y6 Spr)
DK	<ul style="list-style-type: none"> Draw a diagram, a simple scientific drawing that explains or informs (Y1 Spr) 	<p>Draw a scientific diagram, labelling key human body parts</p>	
VCs		<ul style="list-style-type: none"> 7: Living things, including humans, react to their surroundings with their senses 	<ul style="list-style-type: none"> 7: Living things grow, need, water, air and food, react to their surroundings, move, get rid of their waste, reproduce (Y2)

The Earth's crust is it's the outermost layer of our planet. It is made of rocks and minerals. Natural rocks are either igneous, sedimentary or metamorphic Man-made rocks, like concrete, are called anthropic rocks Igneous rock is formed when magma or lava cools down Sedimentary rock is formed when layers of small sediments are compressed over a long period of time. Igneous rock can become sedimentary rock if it breaks down into small pieces and forms layers Metamorphic rock is formed when igneous or sedimentary rock is put under lots of pressure Different rocks have different properties, including permeable/impermeable A fossil is physical evidence of an ancient plant or animal, this could be their preserved remains or other traces that they made when they were alive. Trace fossils are not physical remains of living things they are indirect evidence of life, examples include imprints of, or a mark left by an organism such as a footprint, imprint of a feather or poo Fossils are formed when a living thing or trace is buried under sediment. The remains break down slowly and as layers of sediment build up the layers are squashed, turning them into sedimentary rock Fossils can form when dead organisms are frozen in ice or preserved in amber Soil is a mixture of tiny pieces of rock, dead plants and animals, air and water. Different soils have different properties 	<ul style="list-style-type: none"> History: Rocks that build historical monuments including Stonehenge and the Great Pyramid in Egypt (Y3) History: Importance of fossils in archaeology (Y6) Geography: Beneath the Earth's solid crust is a hot later called the mantle (Y3) Geography: Volcanic eruptions release magma (Y3 Spr) Fossils provide evidence for evolution, because they show how organisms have changed over time (Y6 Aut) The rock cycle and the formation of igneous, sedimentary and metamorphic rocks (KS3) The composition of the Earth (KS3) The structure of the Earth (KS3) Earth as a source of limited resources and the efficacy of recycling (KS3)
Disciplinary	<ul style="list-style-type: none"> A&P: Scientists group objects or living things based on their properties (Y1 Spr) M&O: Observe using a magnifying glass safely (Y2 Spr) M&O: Make systematic observations of an object (Y2 Aut) R&P: Use a pair of axes to classify items based on the extent to which it displays two properties (Y2 Spr) 	<p>Make observations about rocks using senses and magnifying glass, and classify them in a Carroll diagram/pair of axes</p>	
VCs		<ul style="list-style-type: none"> 5: Much of the solid surface of the Earth is covered in soil, which is a mixture of pieces of rock of various sizes and the remains of organisms. Some soil also contains air, water and some nutrients 5: There are many different kinds of rock with different composition and properties. 10: Fossils are the preserved remains or traces of living things 	<ul style="list-style-type: none"> 5: The action of water wears down rock gradually into smaller pieces (see Geography, Year 5 : Investigating water) 5: Beneath the Earth's solid crust is a hot layer called the mantle. The Earth's crust consists of a number of solid plates which move relative to each other, carried along by movements of the mantle. The formation of mountains, earthquakes and volcanic activity are likely to occur at these cracks (see Geography Year 3 Spring: Mountains and Volcanoes and Year 4 Summer: Earthquakes)

Substantive	<ul style="list-style-type: none"> How slow/fast a vehicle moves along a track depends on how hard/gently it is pushed/pulled, how steep the slope is, or whether there is an obstacle in its way (N3-4 Spr1) How slow/fast a boat moves across the water depends on how hard/gently we blow at them through straws (N3-4 Spr1) Solids keep their shape unless a force is put on it. They will change their shape if you cut or squash them (Y2 Sum) 	<ul style="list-style-type: none"> Forces are pushes or pulls Forces arise when objects interact with each other Forces can cause a change in speed, direction or shape of an object Forces act in particular directions Forces that act in opposite directions are called opposing forces. We use arrows to show the size of the force and the direction it acts in. Forces that are equal and act in opposite directions are described as balanced forces, they 'cancel each other out' When forces are balanced, an object will move at a constant speed in the same direction. This includes being stationary! When the forces acting in the opposite directions are not equal this can cause the object they are acting on to move at a different speed or in a different direction. Unbalanced forces can change the shape of an object. Friction is a force between two surfaces that are sliding or trying to slide over each other The bumpier or rougher the surfaces, the more friction there will be 	<ul style="list-style-type: none"> Contact forces require contact between two objects (e.g. friction). Non-contact forces can affect an object at a distance (e.g. magnetism) (Y3 Sum2) Magnetism is a non-contact force exerted by magnets when they attract or repel each other (Y3 Sum2) Gravity is a non-contact force (Y5 Sum) Air and water resistance are contact, frictional forces (Y5 Sum)
Disciplinary	<ul style="list-style-type: none"> Mathematics: Measure length and height (cm/m) (Y2) A&P: Science is studied as three disciplines: biology (study of organisms), chemistry (study of materials) and physics (study of energy) (Y3 Spr) A&P: Dependent, independent and control variables (Y3 Aut) R&P: Design a table to collect data with the appropriate number of rows and columns and correct headings A&E: Make simple statements about the results of an enquiry 	<p>Investigate how the surface of a ramp affects the distance a car will travel</p> <ul style="list-style-type: none"> M&O: Taking multiple readings allows you to see if your data is repeatable and helps you identify anomalous results. M&O: Data is repeatable if the same person repeats the investigation and gets the same results; data is reproducible if the investigation is repeated by a different person and the results are the same M&O: Anomalous results should be discarded and re recorded A&E: Draw conclusions (e.g. 'the greater the... , the greater the...') 	<ul style="list-style-type: none"> The difference between accurate data and precise data (KS3) Using the mean as a method of analysing a set of data (Y6)
VCs	<ul style="list-style-type: none"> 1: Things around us can be made to change or happen. We can pull objects behind us or push them across the table 	<ul style="list-style-type: none"> 3: Forces can push, pull or twist objects, making them change shape or motion 3: Things can only change their motion if there is a net force acting on them 3: When forces acting on an object are not equal and opposite in direction, they are unbalanced and will change an object's speed, direction or shape 	<ul style="list-style-type: none"> 3: An object on Earth pulls the Earth as much as the Earth pulls the object, but because the Earth's mass is much bigger, we observe the motion of the object (Y5) 3: The downward force of gravity on an object on the Moon is less than that on Earth because the Moon has less mass on Earth (Y5)

	Required prior knowledge	Knowledge to be explicitly taught	How knowledge will be built upon
Substantive	<ul style="list-style-type: none"> Magnetic materials are attracted to magnets (N3-4 Spr1) Magnets can repel or attract each other, depending on which way they are held to each other (N3-4 Spr1) Objects have a name and often have a purpose. For example, a cup is the object, and its purpose is for drinking from. The material is what an object is made of, for example a cup can be made of paper or plastic (Y1 Spr) Forces are pushes or pulls (Y3 Sum) Forces can cause a change in speed, direction or shape of an object (Y3 Sum) Forces act in particular directions (Y3 Sum) Forces that act in opposite directions are called opposing forces (Y3 Sum) Forces that are equal and act in opposite directions are described as balanced forces, they cancel each other out (Y3 Sum) Friction is a force between two surfaces that are sliding or trying to slide over each other Geography: The North Pole and the South Pole are at the top and bottom of the Earth (Y1 Spr) 	<ul style="list-style-type: none"> Contact forces require contact between two objects (e.g. friction). Non-contact forces can affect an object at a distance (e.g. magnetism) Friction is a contact force because it requires the two objects to be touching Magnetism is the force exerted by magnets when they attract or repel each other Magnets can exert a force at a distance, which is called a non-contact force Magnets have a north and a south pole. If opposite poles are facing the magnets will be attracted to one another (the magnets pull towards each other). If the same poles are facing the magnets will repel (the magnets will push away from each other). Magnets attract objects made from magnetic materials Some metals are magnetic but not all are. Plastics, wood, fabric, glass are all non-magnetic The closer to the poles of the magnet, the stronger the magnetic force Magnetic forces act at a distance (non-contact force) and can act through materials. A stronger magnet can attract an object through thicker layer of material compared to a weaker magnet. The stronger the magnet, the heavier the object it can attract 	<ul style="list-style-type: none"> Force is measured in newtons (Y5 Sum) Gravity is a non-contact force that pulls all objects towards each other (Y5 Sum) The greater the mass of an object, the greater the gravitational pull around it (Y5 Sum) Gravity is most commonly experienced as the pull of the Earth (and all objects on it) towards each other (Y5 Sum) The Earth's gravitational pull is so large that all objects - regardless of how heavy they are - are pulled towards Earth at the same rate (Y5 Sum) Air resistance is a frictional force that acts between air and a moving object to slow it down (Y5 Sum) Water resistance is a frictional force that acts between water and a moving object to slow it down (Y5 Sum)
Disciplinary	<ul style="list-style-type: none"> Mathematics: Measure length and height (cm/m) (Y2) A&P: Dependent, independent and control variables (Y3 Aut) A&E: Draw conclusions (e.g. 'the greater the... , the greater the...') 	<p>Test which materials are magnetic, and use this knowledge to make predictions about which objects will be magnetic</p> <ul style="list-style-type: none"> A&E: Use findings of an investigation to make further predictions A&E: Suggest ways to improve practical procedures to obtain more accurate measurements

Substantive	<ul style="list-style-type: none"> We see puddles when it's rainy, shadows during the day and rainbows when there is sunshine and rain (N3-4 Aut1) Melting and freezing can be observed in the world around us (N3-4 Aut1) Geography: Precipitation is the fall of water as rain, sleet, snow or hail (Y2 Spr) All materials are made of a single substance or a mixture of substances (Y2 Sum) There are three states of matter: solids, liquids and gases (Y2 Sum) Liquids take the shape of the container they are in, when you move the liquid into a different container the shape will change (Y2 Sum) Solids keep their shape unless a force is put on it. They will change their shape if you cut them or squash them (Y2 Sum) Gases have no fixed shape or volume, they spread out to fill a container. If they are not in a container, they will keep spreading out (Y2 Sum) We can decide if a substance is a solid, liquid or gas by looking at its properties (Yr Sum) One substance can exist in the different states, when the substance is in a different state it is still the same substance (Y2 Sum) 	<ul style="list-style-type: none"> The different substances in their different forms (solids, liquids and gases) are all made of particles The particles in the different states of matter are arranged differently In a solid the particles are packed tightly together, they vibrate slowly and are unable to move away from their neighbours In a liquid the particles are close together but they can slide past each other In a gas the particles are spread out and can move freely Substances can change from one state of matter to another. Solids can change to become a liquid, liquids can change to become a gas, gases can change to become liquids and liquids can change to become a solid The process that changes a solid to a liquid is called melting When you heat a solid it becomes a liquid. Different substances melt at different temperatures, this is called the melting point The process that changes a liquid to a gas is called evaporating Evaporation happens when a liquid is heated. Evaporation is different from boiling. The process that changes a gas to a liquid is called condensing The process that changes a liquid to a solid is called freezing Substances change state at different temperatures, i.e. they have different melting and boiling points Different substances are different states at room temperature The water cycle relies on evaporation and condensation. Water is collected in the oceans from rivers; it evaporates and then condenses to form clouds; it then precipitates and the cycle begins again 	<ul style="list-style-type: none"> When a solid is heated the solid becomes a liquid. Energy from a chemical store is transferred to the solid, and as the solid becomes hotter its thermal store of energy goes up. The particles in the solid therefore move more (Y5 Aut) Conservation of material and of mass, and reversibility, in melting, freezing, evaporation, sublimation, condensation, dissolving (KS3) Similarities and differences, including density differences between solids, liquids and gases (KS3) Brownian motion of gases (KS3) Diffusion in terms of the particle model (KS3) Energy changes on changes of state (KS3)
Disciplinary	<ul style="list-style-type: none"> Mathematics: Measure temperature (°C) and volume (ml/litres) (Y3) A&P: dependent, independent and control variables (Y3 Aut) A&P: Scientists identify factors in an investigation that should be controlled, and try to find ways to control them (Y3 Aut) A&P: Science is studied as three disciplines: biology (study of organisms), chemistry (study of materials) and physics (study of energy) (Y3 Spr) A&P: Scientists identify potential hazards in their experiments and plan ways to reduce them (Y2 Aut) R&P: Draw a diagram, a simple scientific drawing that explains or informs 	<p><i>Investigate the effect of temperature on the rate of evaporation</i></p> <ul style="list-style-type: none"> A&P: Set a hypothesis to test A&E: Scientists use models to help explain their ideas 	<ul style="list-style-type: none"> A&P: Scientists must work out if the factor is the cause of the outcome in a correlation (Y5)
VCs	<ul style="list-style-type: none"> 1: All the 'stuff' encountered in everyday life, including air, water and different kinds of solid substances is called matter (Y2) 1: Different materials are recognisable by their properties (Y2) 	<ul style="list-style-type: none"> 1: The amount of material does not change when a solid melts or a liquid evaporates 1: If a material could be divided into smaller and smaller pieces it would be found to be made of pieces, particles, smaller than can be seen even with a microscope. These particles are not in a material; they are the material 	<ul style="list-style-type: none"> 1: When some materials combine, they do not change permanently and can be separated again (Y5) 1: Materials can be changed by heating and cooling (Y5)

Substantive	<p>Biology:</p> <ul style="list-style-type: none"> In a food chain, the arrows show where the energy is being transferred from and to (Y2 Spr) Leaves use sunlight, carbon dioxide from the air, and water to make their own food (Y3 Spr). They are called producers (Y2 Spr) A food web shows the transfer of energy between different organisms (Y4 Aut) Animals and plants need to digest food to transfer energy from it (Y4 Aut) <p>Physics:</p> <ul style="list-style-type: none"> A complete circuit must have a power source (cell/batteries) and have all the components connected in a loop. If it is missing any of these things it is an incomplete circuit (Y4 Sum) Appliances use electricity to serve a purpose (e.g. toaster, kettle etc.) (Y4 Sum) Sounds are made when objects vibrate. These vibrations cause the air particles surrounding them to vibrate and collide, causing the vibrations to pass between particles (Y4 Spr) <p>Chemistry:</p> <ul style="list-style-type: none"> All substances in their different forms (solids, liquids and gases) are made of particles (Y4 Spr) Melting happens when a solid is heated. Different substances melt at different temperatures. This is called the melting point (Y4 Spr) 	<ul style="list-style-type: none"> Energy can be transferred from one store to another store Fossil fuels, batteries and the Sun are all examples of chemical energy stores Energy stores are needed for something to happen When energy is transferred from one store to another it can be transferred by light, or electrically. When energy is removed from one store and is transferred to another store, the amount of energy in the first store goes down and the amount of energy in the second store goes up Energy is not used up it is just moved around from store to store In a food chain an amount of energy from the Sun (a chemical store) is transferred to the plant by light. The energy is then transferred along the food chain as the different organisms are eaten. In a circuit that has a battery, the battery is the chemical store of energy. Energy is transferred electrically to the device in the circuit, but the device does not store the energy; the device changes the way the energy is transferred. When a solid is heated the solid becomes a liquid. Energy from a chemical store is transferred to the solid, and as the solid becomes hotter its thermal store of energy goes up. The particles in the solid therefore move more When a person pushes or pulls an object their chemical energy store decreases a little. When a person hits a drum to make a sound, their chemical energy store decreases a little. 	<ul style="list-style-type: none"> Thermal conductors allow energy to be transferred through it easily when it is heated (Y4 Sum) Coal, oil and gas are all used to generate electricity. The store of chemical energy in the fuel is transferred electrically to the appliances that we use in the home (Y6 Aut) Energy can be stored and transferred; it cannot be created or destroyed (KS3) A battery is a store of chemical energy (KS3) Energy can be transferred electrically using an electric current (KS3) Energy can be transferred electrically from the battery using an electric current to a device like a lamp or a buzzer.(KS3) Devices such as bulbs do not store the energy. During this process the energy is transferred to a different store.(KS3) Appliances are items that transfer electrical energy to a different store, e.g. light to the surroundings.(KS3)
Disciplinary	<ul style="list-style-type: none"> A&P: Science is studied as three disciplines: biology (study of organisms), chemistry (study of materials) and physics (study of energy) (Y3 Spr) A&E: Scientists use models to help explain their ideas (Y4 Spr) 	<ul style="list-style-type: none"> A&P: Science is studied as three disciplines: biology (study of organisms), chemistry (study of properties of matter and how it interacts with energy) and physics (study of energy) 	<ul style="list-style-type: none"> More sophisticated understanding of the difference in scientific disciplines and the links between them (KS3)
VCs	<ul style="list-style-type: none"> 4: Things around us can be made to change or happen. We can pull objects behind us or push them across the table (Y1) 4: All living things need food to give them energy (Y2) 4: The arrows in food chains (Y2) and food webs (Y4) show where the energy is being transferred from/to. 	<ul style="list-style-type: none"> 4: Many processes and phenomena are explained in terms of energy exchanges 4: Energy cannot be created or destroyed. When energy is transferred from one object to others, the total amount of energy in the universe remains the same; the amount that one object loses is the same as the other objects gain 	<ul style="list-style-type: none"> 4: Across the world, the demand for energy increases as human populations grow and modern lifestyles require more energy, particularly electrical energy (Y6)

	Required prior knowledge	Knowledge to be explicitly taught	How knowledge will be built upon
Substantive	<ul style="list-style-type: none"> Parents and their young animals look similar and different (N3-4 Spr2) Germination is the development of a plant from a seed. During germination roots and shoots emerge and grow (Y2 Aut) Some plants grow from bulbs (Y2 Aut) A seed is the embryonic stage of the plant life cycle (Y2 Aut) Animals, including humans, reproduce. This means they have offspring that grow into adults (Y2 Aut) As animals grow they get bigger, some animals change during their life cycle as the mature (e.g. tadpole to frog) (Y2 Aut) The four main stages of the plant's life cycle include germination, pollination, fertilisation and seed dispersal (Y3 Spr) Pollination and fertilisation usually takes place in flowers. Dispersal is important to make sure there is enough space for seeds to germinate and plants to grow (Y3 Spr) A species is a group of one type of organism, individuals in this group can breed with each other to produce offspring that can go on to breed (Y4 Aut) Fish, amphibians, reptiles, birds and mammals are all vertebrates (Y4 Aut) Invertebrates can be grouped based on their characteristics as snails and slugs; worms; spiders and insects (Y4 Aut) 	<ul style="list-style-type: none"> Plants and animals look similar to their parents in many features because information is passed from one generation to the next. This information comes from the parents' genome. Sexual reproduction involves two parents - usually male and female - creating a new organism by mixing their genomes Sexual reproduction begins with fertilisation of an egg, which mixes the genes from two parents. Fertilisation can be internal or external After an egg is fertilised, an embryo will develop. Embryos develop inside the body in the gestation period for viviparous animals. Embryos develop outside the body in eggs for oviparous animals Viviparous animals are born, oviparous animals hatch from eggs, plant seeds germinate Almost all mammals are viviparous; all birds and most amphibians are oviparous Amphibians and most insects undergo metamorphosis Life cycle of: <ul style="list-style-type: none"> hedgehog: internal fertilisation, gestation, hoglet, adult peregrine falcon: internal fertilisation, embryo is incubated in eggs, hatchling, fledgling, adult frog: external fertilisation, frogspawn, tadpole, tadpole with legs, adult frog (metamorphosis) ladybird: internal fertilisation, eggs hatch, larva, pupa, adult Most plants have both male and female parts The male part of the plant is called the stamen, made up of the anther and filament, and the anther produces pollen grains. A cell is the smallest building block of living things. All organisms are made of cells There are lots of different types of cell, which each have different purposes The female parts of the plant are the ovary (which produces the female sex cells which are contained in the ovule) and the stigma which collects pollen Asexual reproduction does not involve sex cells or fertilisation. Only one parent is needed and offspring are (genetically) identical to the parent and each other. Potatoes develop tubers and daffodils have bulbs, which will grow to be identical copies of the plant 	<ul style="list-style-type: none"> The human life cycle goes through the same stages as those for other animals: fertilisation, gestation, growth (Y5 Spr) Humans are viviparous and a foetus develops inside the mother (or surrogate mother). A human embryo is considered a foetus at the end of the 8th week of pregnancy (Y5 Spr) The gestation period for humans is 40 weeks The bigger the animal, the longer the gestation period (Y5 S2) A foetus is considered a baby when it is born (Y5 Spr) Fertilisation in most humans is internal, but it can happen externally (in vitro fertilisation - IVF - which means 'in glass' fertilisation) (Y5 Spr)
Disciplinary	<ul style="list-style-type: none"> A&P: Scientists conduct secondary research to learn from what other scientists have already learned (Y1 Spr) A&P: Science is studied as three disciplines: biology (study of organisms), chemistry (study of properties of matter and how it interacts with energy) and physics (study of energy) (Y5 Aut) M&O: Gather information from text/books/images (Y1 Aut) and the internet (Y3) 	<p>Using images, text and the internet to research internal and external fertilisation, and viviparous and oviparous organisms</p>	
VCs	<ul style="list-style-type: none"> 9: Plants and animals reproduce (have offspring) (Y1) 	<ul style="list-style-type: none"> 9: Organisms produce offspring of the same kind, but in many cases offspring are not identical with each other or with their parents. 9: Plants and animals, including humans, resemble their parents in many features because information is passed from one generation to the next. 9: Not all information is passed on from one generation to the other in the same way; some skills and behaviour have to be learned 10: Although organisms of the same species are very similar, they vary a little 	<ul style="list-style-type: none"> 9: In a human body, most cells contain 23 pairs of chromosomes. These provide information that is needed to make more cells in growth and reproduction (KS3)

Substantive	<ul style="list-style-type: none"> Forces are pushes or pulls that act in particular directions. They can cause a change in speed, direction or shape of an object (Y3 Sum) Forces that act in opposite directions are called opposing forces (Y3 Sum) Forces that are equal and act in opposite directions are described as balanced forces. They 'cancel each other out' (Y3 Sum) When forces are balanced, an object will move at a constant speed in the same direction. This includes being stationary (Y3 Sum) Contact forces require contact between two objects (e.g. friction). Non-contact forces can affect an object at a distance (e.g. magnetism) (Y3 Sum) Friction is a force between two surfaces that are sliding or trying to slide over each other (Y3 Sum) Friction is a contact force because it requires the two objects to be touching (Y3 Sum) The bumpier or rougher the surfaces, the more friction there will be (Y3 Sum) 	<ul style="list-style-type: none"> Force is measured in newtons (N) Gravity is a non-contact force that pulls all objects towards each other. The greater the mass of the object, the greater the gravitational pull around it. Gravity is most commonly experienced as the pull of the Earth (and all objects on it) towards each other The Earth's gravitational pull is so large that all objects - regardless of how heavy they are - are pulled towards Earth at the same rate Mass is a measure of how much matter something is made from, which is measured in kg (or equivalent). The mass of an object is always the same. Weight is a force, it is measured in newtons (N) The weight of an object will differ depending on the force of gravity. Air resistance is a frictional force that acts between air and a moving object to slow it down Surface area is the area that is facing the direction the object is travelling in. The larger the surface area of an object, the greater the air resistance Water resistance is a frictional force that acts between water and a moving object to slow it down Levers, pulleys and gears allow a smaller force to have a greater effect. Examples of levers, pulleys and gears include wheelbarrows, lifts, bicycle gears, in construction Levers consist of a beam and a fulcrum (pivot). Effort lifts a load. The greater the distance from the effort to the fulcrum, the less effort is required to move the load Upthrust is an upwards force that a liquid (and a gas) exerts on an object floating in it. If upthrust is equal to the weight of an object it will float. 	<ul style="list-style-type: none"> The Earth's Moon is smaller than the Earth and has less mass, so its gravitational force is less (Y5 Sum) Using force arrows in diagrams, adding forces in one dimension, balanced and unbalanced forces (KS3) Moment as the turning effect of a force (KS3) Forces associated with deforming object; stretching and squashing- springs (KS3) Measurement of stretch or compression as force is changed (KS3) Work done and energy changes in deformation (KS3) Non-contact forces: gravity forces acting at a distance on earth and in space, forces between magnets and forces due to static electricity (KS3) Opposing forces and equilibrium; weight held by stretched spring or supported on a compressed surface (KS3) Forces being needed to cause objects to stop or start moving, or to change their speed or direction of motion (KS3) Change depending on direction of force and its size (KS3)
Disciplinary	<ul style="list-style-type: none"> Mathematics: Round numbers with 1 decimal place to the nearest whole number (Y4); Understand difference between discrete and continuous data (Y4); Interpret and construct bar and line graphs (Y4); Area is the space inside a shape and can be measured by counting squares (Y4) A&P: Dependent, independent and control variables (Y3 Aut) A&P: Scientists identify factors in an investigation that should be controlled, and try to find ways to control them (Y3 Aut) M&O: Anomalous results should be discarded and rerecorded (Y3) M&O: Data is repeatable if the same person repeats the investigation and gets the same results; data is reproducible if the investigation is repeated by a different person and the results are the same (Y3 Sum) M&O: Taking multiple readings allows you to see if your data is repeatable, and helps identify outliers (Y3 Sum) 	<p><i>Investigate how much force is required to pull objects over different surfaces</i></p> <ul style="list-style-type: none"> M&O: Measure force using a Newtonmeter <p><i>Investigate how surface area affects air resistance, and how shape affects water resistance</i></p> <ul style="list-style-type: none"> A&P: Scientists must work out if the factor is the cause of the outcome in a correlation R&P: Line graphs can be used when data is continuous; bar charts can be used when data is discrete A&E: Make judgements on the accuracy of the data 	
VCs	<ul style="list-style-type: none"> 2: Objects can have an affect on other objects even when they are not in contact with them: light (Y3), magnetism (Y3), sound (Y4) 3: Forces can push, pull or twist objects, making them change shape or motion (Y3); Things can only change their motion if there is a net force acting on them (Y3); When forces acting on an object are not equal and opposite in direction, they are unbalanced and will change an object's speed, direction or shape (Y3) 	<ul style="list-style-type: none"> 2: The non-contact force of gravity makes things fall to Earth 2: There is gravitational force between all objects, but it is only felt when one or more of the objects has a very large mass 3: An object on Earth pulls the Earth as much as the Earth pulls the object, but because the Earth's mass is much bigger, we observe the motion of the object 	<ul style="list-style-type: none"> There is attraction and repulsion between objects that are electrically charged (KS3); Visible light and other forms of radiation can travel through any empty space (KS3); How quickly an object's motion is changed depends on the force acting and the object's mass. The greater the mass of the object, the longer it takes to speed it up or slow it down (inertia) (KS3)

VCs	<ul style="list-style-type: none"> • 6: Daytime is when the Earth is facing the Sun; nighttime is when the Earth is facing away from the Sun (Y1) • 6: The Moon reflects light from the Sun (Y3) 	<ul style="list-style-type: none"> • 3: The downward force of gravity on an object on the Moon is less than that on Earth because the Moon has less mass on Earth • 6: Our Sun is one of many stars that make up the Universe. • 6: The distances between us and the bodies in solar system is huge, and even bigger in the Universe 	<ul style="list-style-type: none"> • 6: The tilt of the Earth's axis gives rise to seasons (KS3) • 6: The movements of galaxies suggest that the Universe is expanding from a past state called the 'big bang', towards a future that is still unclear (KS3)

	Required prior knowledge	Knowledge to be explicitly taught	How knowledge will be built upon
Substantive	<ul style="list-style-type: none"> A complete circuit must have a power source (cell/batteries) and have all the components connected in a loop. If it is missing any of these things it is an incomplete circuit (Y4 Sum) A short circuit is the easiest route for electricity to travel and can be created by accident by connecting just the wire to the cell in a circuit. They can be dangerous (Y4 Sum) Components include wire, lamp, buzzer, motor or switch Materials that allow electricity to flow through them easily are called electrical conductors; materials that do not are called electrical insulators (Yr4 Sum) Appliances use electricity to serve a purpose (e.g. toaster, kettle etc.) (Y4 Sum) Energy can be transferred from one store to another store (Y5 Aut) Fossil fuels, batteries and the Sun are all examples of chemical energy stores (Y5 Aut) In a circuit that has a battery, the battery is a chemical store of energy. Energy is transferred electrically to the device in the circuit, but the device does not store energy. Instead, it changes the way that it is transferred (Y5 Aut) Geography: Fossil fuels are materials made from fossils of organisms over millions of years, like coal and oil. Humans use these to run cars/electrical items (Y5 Aut) 	<ul style="list-style-type: none"> There are recognised symbols for cell, lamp, buzzer, motor, and switch. Wires are represented with straight lines As long as batteries have the same voltage, the size of the battery does not affect the brightness of the lamp/loudness of the buzzer (though the smaller batteries will not last as long as the larger ones) Adding more cells in the circuit increases the voltage. Increasing the voltage in a circuit makes the lamp in the circuit get brighter or the buzzer get louder. More than one lamp can be put into one circuit. They can be placed in series or in parallel. In a series circuit, the lamps are placed in a continuous loop. In parallel, the lamps are placed in separate loops that both connect to the cell Connecting lamps in parallel means that if one lamp burns out the other will stay on and switches can be used to turn each lamp off independently. Many of the appliances used in the home do not use batteries they use mains electricity. Mains electricity is generated in a power station and transferred to our homes by overhead cables. Power stations can use both renewable and non-renewable sources of energy to generate electricity. A non-renewable energy source is one where we have a fixed amount of the source, and where it would take too long for more to be formed. Burning fossil fuels to transfer electrical energy is a non-renewable energy source Renewable energy sources quickly replenish themselves, meaning that we can use them again and again. Wind, solar, geothermal and hydrological power are all examples of renewable energy sources Coal, oil and gas are all used to generate electricity. The store of chemical energy in the fuel is transferred electrically to the appliances that we use in the home. 	<ul style="list-style-type: none"> Geography: Improving the environment, and places in the world that have climates or physical features that lend themselves to using renewable sources to generate electricity (Y6 Aut2) Electric current is measured in amperes using an ammeter. Current is a flow of charge (KS3) Current can be measured in parallel and series circuits. The current will be the same at all points in a series circuit (KS3) Current splits where the circuit branches in a parallel circuit, currents add where branches meet (KS3) Potential difference is measured in volts (V) using a voltmeter. It is measured across a component (KS3) In a series circuit the sum of the potential difference across all components will equal the battery voltage. In a parallel circuit the potential difference across each of the components will be the same as that of the battery (KS3) Resistance is measured in ohms and is the ratio of potential difference to current (KS3) Conducting and insulating components will differ in resistance (KS3)

Substantive	<ul style="list-style-type: none"> Living things have adapted to their environment. This means they may not be able to survive in other habitats (Y2 Spr) A fossil is physical evidence of an ancient plant or animal, this could be their preserved remains or other traces that they made when they were alive. Trace fossils are not physical remains of living things they are indirect evidence of life (Y3 Aut) A species is a group of one type of organism, individuals in this group can breed with each other to produce offspring that can go on to breed. (Y4 Aut) Geography: Animals and plants have adapted to life in the rainforest (butterfly roots, lianas, spider monkey, toucan, and fire ants) (Y4 Spr) Sexual reproduction is two parents - usually male and female - create a new organism by mixing their genomes (Y5 Spr) History: Homo sapiens first lived in East Africa ~200,000 BC and migrated across the world over 1000s of years (Y5 Sum) Geography: Flora and fauna that have adapted to life in the tundra (Arctic hare, polar bear) hot desert (cactus, camel, Saharan silver ant, cape ground squirrel) temperate forest (deciduous and coniferous trees, red squirrels, hedgehogs, and southern wood ants) coral reefs (soft coral, pistol shrimp & goby fish, octopus & grouper) (Y5 Sum) 	<ul style="list-style-type: none"> Variation occurs within and between species Variation can be environmental or genetic, or a mixture of both Genetic variation happens randomly through the mixing of genomes in sexual reproduction. Some variation is advantageous to the organism in their environment; sometimes it is disadvantageous; and sometimes it gives no advantage/disadvantage An organism with advantageous traits are more likely to survive and reproduce, passing those traits to the next generation. This is called natural selection These advantageous traits - adaptations - can be physiological, structural and behavioural Over many generations, the species will evolve so that all organisms have this adaptation/advantageous trait Homo sapiens originated in many parts of Africa Fossils provide evidence for evolution, because they show how organisms have changed over time Scientists involved in the development of evolutionary biology include Al-Jahiz, Charles Darwin, Alfred Wallace, Mary Anning and Dr Danielle Lee 	<ul style="list-style-type: none"> Hereditary is the process by which genetic variation is transmitted from one generation to the next (KS3) Chromosomes are made of DNA. Small sections of DNA are called genes. We inherit genes from our parents and this is how genetic variation is transmitted from one generation to the next. (KS3) Variation between individuals of the same species is either continuous or discontinuous, this variation means that some individuals will compete more successfully and are more likely to survive, this drives a process known as natural selection. In this process advantageous versions of genes are passed onto offspring (KS3) Changes to the environment can lead to individuals of some species or even entire species less well adapted to their environment. This can lead to extinction. Biodiversity is important and we need to maintain it (KS3)
Disciplinary	<ul style="list-style-type: none"> A&E: Identify scientific evidence that has been used to support or refute ideas (Y4 Aut) R&P: Use a Venn diagram to classify items into two or three sets based on properties (Y1 Sum) A&P: Science is never 'complete' and scientists are always working to make models more accurate or to discover new explanations (Y5 Sum) 	<p><i>Sort variations within species in a Venn diagram, based on whether they are genetic, environmental or a mixture of both</i></p> <p><i>Identify how evidence of fossils has been used to support to change the theory of the evolution of Homo sapiens</i></p>	
VCs	<ul style="list-style-type: none"> 8: Animals are ultimately dependent on plants for their survival (Y4) 10: Although organisms of the same species are very similar, they vary a little from each other (Y5) 	<ul style="list-style-type: none"> 8: In any given ecosystem there is competition among species for the energy and materials they need to live. 10: There are many kinds of organisms that were once alive but are now extinct. We know about extinct animals from fossils. 10: Living things are found in certain environments because they have the features that enable them to survive there. This adaptation to their environment has come about because of the small differences that occur during reproduction, resulting in some individuals being better suited to the environment than others. In the competition for materials and energy, those that are better adapted will survive and are more likely to pass on their adapted feature to their offspring. 	<ul style="list-style-type: none"> 8: Decomposers are essential (alongside producers and consumers) for a stable ecosystem (KS3) 10: The natural selection of organisms has been going since the first form of life appeared on Earth 3.5 billion years ago (KS3) 10. Multi-cellular organisms evolved around 2 billion years ago (KS3)

Substantive	<ul style="list-style-type: none"> We see shadows during the day and rainbows when there is sunshine and rain (N3-4 Aut1) Light travels in straight lines (Y3 Aut) We see when light enters our eyes (Y3 Aut) Darkness is the absence of light (Y3 Aut) Sources of light emit their own light, and others reflect light; both occur in nature as well as man-made objects (Y3 Aut) Opaque, translucent and transparent materials allow no, some or all light to pass through them (Y3 Aut) Shadows form behind an opaque object when light from a source is blocked (Y3 Aut) The shape and position of shadows changes with the angle of the light source (Y3 Aut) The size of shadows changes when the distance of the light source changes (Y3 Aut) Light from the sun can be dangerous and there are ways to protect our eyes and skin. (Y3 Aut) Energy can be transferred from one store to another store (Y5 Aut) Fossil fuels, batteries and the Sun are all examples of chemical energy stores (Y5 Aut) When energy is transferred from one store to another, it can be transferred by light or electrically (Y5 Aut) When energy is removed from one store and is transferred to another store, the amount of energy in the first store goes down and the amount of energy in the second store goes up (Y5 Aut) Energy is not used up; it is just moved around from store to store (Y5 Aut) Light travels from the Sun to the Earth (Y5 Sum) 	<ul style="list-style-type: none"> When light meets an opaque object, some of the light is reflected and some of it is absorbed Shadows have the same shape as the objects that cast them because light travels in straight lines. The size and shape of shadows behind an opaque object can be explained using ray diagrams Objects emit (give out) or reflect light into the eye. We see things because light travels from light sources to our eyes, or from light sources to objects and then to our eyes In ray diagrams, straight lines with arrows show where the energy is being transferred from and to by light Objects would be invisible if they did not reflect light. The eye is made of many parts: the pupil is the circular black hole in the center of the eye, the iris is the coloured part of the eye that surrounds the pupil, and the lens is a structure found behind the pupil. The pupils allow light to enter the eye The iris controls how much light enters the eye by changing the size of the pupil. The lens helps to focus the light rays entering the eye White light, which comes from most light sources we use in the classroom, contains all the colours of the visible spectrum (red, orange, yellow, green, blue, indigo, violet) When a light meets a surface, some colours are absorbed and some are reflected. We see the colour(s) that are reflected Objects appear black if they absorb all the colours in white light, and reflect none. Objects appear white if they reflect all the colours in white light, and absorb none Many problems with our vision are caused by parts of the eye that are not the right shape or size, or that have become cloudy. Many of these problems can be corrected through surgery or prescription glasses People living with sight loss or blindness may use long canes or guide dogs when outside, talking books or Braille, and different devices in the home On a flat surface, all light meeting a surface from one direction will be reflected in the same direction. This is known as specular reflection On a rough surface, light will be reflected in all directions. This is known as diffuse reflection Specular reflection between mirrors allow us to see the objects that do not directly reflect light into our eyes (e.g. periscope) 	<ul style="list-style-type: none"> The transmission of light through materials, to include absorption, diffuse scattering and specular reflection at a surface (KS3) Light waves can travel through a vacuum they do not require a medium (KS3) Light waves travel at the speed of light (KS3) The similarities and differences between light waves and waves in matter (KS3) Use of ray model to explain imaging in mirrors, the pinhole camera, the refraction of light and the action of a convex lens in focusing (KS3) The human eye (KS3) Light transferring energy from a source to an absorber leading to chemical and electrical effects; photosensitive material in the retina and in cameras (KS3) Colours and the different frequencies of light, white light and prisms; differential colour effects in absorption and diffuse reflection (KS3)
DK	<ul style="list-style-type: none"> R&P: Draw a diagram, a simple scientific drawing that explains or informs 	<i>Draw ray diagrams to show how light travels and how shadows are formed</i>	
VCS	<ul style="list-style-type: none"> 2: Objects can have an affect on other objects even when they are not in contact with them. Light reaches our eyes, even though the light source may be far away (Y2) 		<ul style="list-style-type: none"> 2: Visible light and other forms of radiation can travel through any empty space (KS3)

Substantive	<ul style="list-style-type: none"> Coniferous plants keep their leaves all year round; deciduous plants lose their leaves in winter (Y1 Aut) The stem/trunk supports the plant and transports water up the plant. The xylem transports water and nutrients from the roots, and the phloem transports food from the leaves to the all parts of the plant (Y3 Spr2) Seeds can be dispersed by wind (e.g. sycamore), by animals in their droppings (e.g. things that are eaten, like a raspberry), attached to animal fur (e.g. goosegrass), or seeds can be self-propelled (pea pod) (Y3 Spr2) Classification refers to a method used to place all living things into groups. Organisms can be classified in a number of ways (Y4 Aut) A species is a group of one type of organism, individuals in this group can breed with each other to produce offspring that can go on to breed (Y4 Aut) Fish, amphibians, reptiles, birds and mammals are all vertebrates. Vertebrates have endoskeletons (Y4 Aut) Vertebrates can be grouped in a number of ways based on their characteristics, e.g. warm/cold blooded; or physical features like fur, beak, wings etc. (Y4 Aut) Invertebrates can be grouped based on their characteristics as snails and slugs; worms; spiders and insects (Y4 Aut) Invertebrates can be grouped based on their skeletons; endoskeletons, exoskeletons, or hydrostatic skeletons (Y4) Plants can be grouped into flowering and non-flowering plants (Y4 Aut) Geo: A symbiotic relationship is a long-term relationship between one or more species. Mutualism is where this both species in the relationship receive benefits (Y4 Spr) Asexual reproduction does not involve sex cells or fertilisation. Only one parent is needed, and the offspring are (genetically) identical to the parent and each other (Y5 Spr) A cell is the smallest building block of living things. All organisms are made of cells (Y5 Spr) 	<ul style="list-style-type: none"> Invertebrates can be grouped based on their characteristics as poriferans (sponges) cnidarians, echinoderms, molluscs, annelids, platyhelminths and arthropods Arthropods can be grouped into 4 sub-groups: spiders, insects, crustaceans and myriapods). Plants can be grouped into moss, ferns, conifers and flowering plants Fungi are different to plants and animals. They cannot make their own food (like animals) but do not move (like plants) Micro-organisms are organisms that are so small that we cannot see them with our eyes alone. Some fungi are microorganisms (e.g. yeast), but not all are (e.g. mushrooms) Bacteria and viruses are microorganisms. Some bacteria can cause disease in other organisms Some bacteria are helpful for other organisms (e.g. those that help break down food in our digestive system) and those that form part of a symbiotic relationship 	<ul style="list-style-type: none"> Plants and animals are made of cells. There are similarities and differences between the cells of animals and plants. (KS3) Many plant cells have chloroplasts, and this enable plants to photosynthesise. The reactants of this process are carbon dioxide and water, and the products are sugar (glucose) and oxygen. (KS3) The differences between species and how this difference can drive natural selection. (KS3)
Disciplinary	<ul style="list-style-type: none"> Gather information from text/books/images (Y2 Spr) and the internet (Y3 Spr) R&P: Use a classification key to identify an object (Y4 Aut) R&P: Draw a dichotomous classification key to help others identify an object (Y4 Aut) R&P: Present information in a written format (Y4 Sum) 	<p><i>Use and draw classification keys to help classify invertebrates and plants</i></p> <p><i>Research the harmful effects that bacteria can have on humans and other organisms, and present this information in a written format</i></p>	
VCs	<ul style="list-style-type: none"> 7: Living things – organisms – need water, air, food, a way of getting rid of water and an environment that stays within a particular temperature range (Y3) 	<ul style="list-style-type: none"> 7: Micro-organisms are organisms that are so small that we cannot see them with our eyes alone 	<ul style="list-style-type: none"> 7: All organisms are made of one or more cells, which can only be seen through a microscope (KS3); All the basic functions of life – growth, reproduction, extracting energy from food – are the results of what happens inside cells (KS3)

	Required prior knowledge	Knowledge to be explicitly taught	How knowledge will be built upon
Substantive	<ul style="list-style-type: none"> Humans are made of many different body parts (Y1 Sum) Humans need exercise to stay healthy (Y2 Aut) Living things move, reproduce, are sensitive to their surroundings, grow, need oxygen, get rid of their waste, and need nutrition (MRS GOWN) (Y2 Spr) Humans need a balanced diet of these food groups (Y3 Spr) Organs are parts of the body that do a particular job, the heart pumps blood around the body and the lungs are used for breathing which gets air into your body. (Y3 Spr) Oxygen and carbon dioxide are found in the air (Y3 Spr) The digestive system is the group of organs that help your body digest food (Y4 Aut) Food is further broken down (chemical digestion) in the small intestines where most of the nutrients are absorbed (Y4 Aut) A cell is the smallest building block of living things. All organisms are made of cells (Y5 Spr) There are lots of different types of cell, which each have different purposes (Y5 Spr) 	<ul style="list-style-type: none"> Living things move, reproduce, are sensitive to their surroundings, grow, respire, excrete, and need nutrition (MRS GREN) Respiration provides the energy needed for organisms to function. Oxygen and glucose (a sugar) are needed by cells for respiration. Carbon dioxide is a waste product of respiration and needs to be excreted. Blood carries oxygen, glucose, nutrients, and carbon dioxide to and from cells around the body Optional: the blood is made of plasma, red blood cells, platelets and white blood cells. The heart is a muscle that pumps the blood through the blood vessels. Optional: the heart contains four chambers: the left and right atria and the left and right ventricles. The heart pumps deoxygenated blood to the lungs, where oxygen is transferred to it, and it flows back to the heart. The heart pumps oxygenated blood to the rest of the body, where the oxygen is transferred to the organs/muscles and carbon dioxide is transferred to the blood. Deoxygenated blood then travels back to the heart to begin the process again. Glucose and nutrients are absorbed by the blood along the small intestine and transported to cells in the body. Arteries carry blood away from the heart. Arteries have thick walls because they carry blood from the heart which is at a high pressure. Blood is being pumped through very quickly. Arteries mostly carry oxygenated blood. Veins carry blood back to the heart. They mostly carry deoxygenated blood. Arteries branch into smaller blood vessels called capillaries, which are very small and supply our cells with oxygen, glucose and nutrients. Capillaries collect carbon dioxide from the cells and merge into veins. The heart rate is how quickly the heart pumps. It is usually measured in beats/min. Muscles need more oxygen when they are being used in exercise, so the heart rate increases Being healthy means we are in a state of physical, mental and social well being and are free from disease Diet and exercise can have a positive effect on our bodies. Other lifestyle choices have an impact on our health. A drug is a substance that, when taken into the body, has an effect on it. Some drugs (medicines) are helpful, and some are only harmful. All drugs are harmful when taken in the wrong quantities. Tobacco smoke contains nicotine, tar and carbon monoxide. These have a damaging effect on the body. 	<ul style="list-style-type: none"> The hierarchical organisation of multicellular organisms. Organisms consist of organ systems which are made of organs. Organs are a collection of different tissues and tissues are made of cells. An example being the circulatory system (KS3) Aerobic respiration occurs in the cells of organisms, it involves the breakdown of organic molecules (sugar) and using oxygen (KS3) The blood is oxygenated in the lungs and this is transported to the organs (and cells) that require it for aerobic respiration, along with sugar, by the blood vessels in the circulatory system (KS3) Gas exchange systems in humans are adapted to their function as they have many alveoli which provides a large surface area for diffusion (KS3) The mechanism of breathing moves air in and out of the lungs (KS3) The role of diffusion in the movement of materials in and between cells (KS3) The impact of smoking on the human gas exchange surface. (KS3)
Disciplinary	<ul style="list-style-type: none"> Mathematics: Calculate and interpret the mean (Y6) A&P: Make a prediction based on substantive knowledge (Y2 Aut); A&E: Use scientific understanding to explain their findings (Y3 Sum) A&P: Scientists must work out if the factor is the cause of the outcome in a correlation (Y5 Sum) M&O: Taking multiple readings allows you to see if your data is repeatable and helps identify outliers (Y3 Sum) 	<p>Investigate the effect of exercise on heart rate</p> <ul style="list-style-type: none"> M&O: Planning to take multiple readings allows anomalous data to be identified and enables a mean to be calculated. Repeats show if our data is repeatable. A&E: Calculating the mean can be used as a method of analysing data <p>Research effects of smoking on the human body, and how our scientific understanding has changed over time, including in the current day. The difference between correlation and cause can be discussed in relation to the move from saying smoking is bad for your health to the idea of the many disease smoking cause.</p>	
VCS			<ul style="list-style-type: none"> 7: All organisms are made of one or more cells, which can only be seen through a microscope (KS3); Cells are often aggregated into tissues, tissues into organs, and organs into organ systems (KS3)

	Required prior knowledge	Knowledge to be explicitly taught	How knowledge will be built upon
Substantive	<ul style="list-style-type: none"> • Digestion in the human body can be chemical and mechanical (Y4 Aut) • Physical properties are properties that we can measure or observe in the classroom. They include electrical conductivity; melting and boiling points; thermal conductivity; being malleable; windproof; hard/soft; and magnetic (Y4 Sum) • Chemical properties are properties that scientists need specialist equipment to measure. They include flammability and toxicity (Y4 Sum) • A mixture is two or more substances, e.g. air, steel (Y5 Aut) • Mixtures can be made of two gases (e.g. air), two solids (e.g. steel), two liquids (e.g. squash and water), or a liquid and a solid (e.g. salt water) (Y5 Aut) • A solvent is a liquid that is used to dissolve other substances (Y5 Aut) • A reversible change is a change that can be undone, where the original substances can be recovered (Y5 Aut) • An irreversible change is a change that cannot be undone, where the original substances cannot be recovered (Y5 Aut) 	<ul style="list-style-type: none"> • A mixture is two or more substances that are mixed but not chemically joined together • Distillation is a separating technique that can separate a solvent from a solution. It relies on evaporation and condensation. • Chromatography is a separation technique in which a mixture is dissolved into a solvent, and the components of the mixture are carried by the solvents at different rates. • A chemical change is a change where a new substance is formed. • A chemical change has usually taken place if: gas bubbles appear; a new solid appears; it changes colour; or changes temperature • A physical change is where the substance changes its properties, but it does not become a different substance • Some chemical changes are irreversible, (e.g. cook an egg, rusting iron), but some can be reversed • Most physical changes are reversible (e.g. water to ice), but some are not (e.g. crack an egg, turn wood into sawdust) • Chemical reactions can be summarized using word equations. • Word equations show the names of the chemicals reacting and the names of the products formed. 	<ul style="list-style-type: none"> • In an chemical reaction mass is conserved (KS3) • In a chemical reaction there is a rearrangement of atoms. (KS3) • Chemical reactions can be represented using formulae and equations (KS3) • Examples of types of chemical reactions include combustion, thermal decomposition, oxidation neutralisation and displacement (KS3) • Reactions of acids with metals produces a salt and hydrogen (KS3) • Reactions of acids with alkalis produces a salt and water (KS3) • Reactions can be endothermic or exothermic (KS3)
Disciplinary	<ul style="list-style-type: none"> • A&P: Scientists group objects or living things based on their properties (Y1 Spr) • A&P: Make a prediction based on substantive knowledge (Y2 Spr) • A&P: Scientists identify potential hazards in their experiments and plan ways to reduce them (Y2 Spr) • R&P: Use a Carroll diagram to classify items based on properties (Y1 Spr) • R&P: Use a classification key to identify an object. Draw a dichotomous classification key to help others identify an object (Y4 Aut) • R&P: Present information in a written format 	<p>Use a Carroll diagram to classify changes as physical/chemical and reversible/irreversible</p> <p>Carry out changes and identify whether the change created is physical/chemical and reversible/irreversible</p>	
VCs	<ul style="list-style-type: none"> • 1: All the 'stuff' encountered in everyday life, including air, water and different kinds of solid substances is called matter (Y2) • 1: Different materials are recognisable by their properties (Y2)
